

Introduction

Comp3231
Operating Systems
Kevin Elphinstone

Course Outline

- Prerequisites
 - COMP2011 Data Organisation
 - COMP2021 Digital Systems Structure
 - or the postgraduate equivalent
- You are expected to be competent programmers!!!!
 - We will be using the C programming language
 - The dominant language for OS implementation.

COMP3231 04s1

2

Lectures

- Wednesday, 2-4pm
- Thursday, 5-6pm
 - All lectures are here (EE LG1)
 - The lecture notes will be available on the course web site
 - Available prior to lectures, when possible.
 - The lecture notes and textbook are NOT a substitute for attending lectures.

COMP3231 04s1

3

Tutorials

- Start in week 2
- A tutorial participation mark will contribute to your final assessment.
 - Participation means participation, NOT attendance.
 - Comp9201 students excluded
- You will only get participation marks in your enrolled tutorial.

COMP3231 04s1

4

Announcement

- We have added an extra tutorial on Thursday at 10am.
- Consider moving if you can.

COMP3231 04s1

5

Assignments

- Assignments form a substantial component of your assessment.
- They are challenging!!!!
 - Because operating systems are challenging
- We will be using OS/161,
 - an educational operating system
 - developed by the [Systems Group At Harvard](#)
 - It contains roughly 20,000 lines of code and comments

COMP3231 04s1

6

Assignments

- Don't under estimate the time needed to do the assignments.
- If you start a couple days before they are due, you will be late.
- To encourage you to start early,
 - Bonus 10% of max mark of the assignment for finishing a week early
 - To iron out any potential problems with the spec, 5% bonus for finishing within 48 hours of assignment release.
 - See course handout for exact details
 - Read the fine print!!!!

COMP3231 04s1

7

Assignments

- We usually offer advanced versions of the assignments
 - Available bonus marks are small compared to amount of effort required.
 - Student should do it for the challenge, not the marks.
 - Attempting the advanced component is not a valid excuse for failure to complete the normal component of the assignment

COMP3231 04s1

8

Assignments

- Four assignments
 - due roughly week 3, 6, 9, 13
- The first one is trivial
 - It's a warm up to have you familiarize yourself with the environment and easy marks.
 - Do not use it as a gauge for judging the difficulty of the following assignments.

COMP3231 04s1

9

Assignments

- Late penalty
 - 4% of total assignment value per day
 - Assignment is worth 20%
 - You get 18, and are 2 days late
 - Final mark = $18 - (20 \cdot 0.04 \cdot 2) = 16$ (16.4)
- Assignments are only accepted up to one week late. 8+ days = 0

COMP3231 04s1

10

Assignments

- To help you with the assignments
 - We dedicate a tutorial per-assignment to discuss issues related to the assignment
 - We provide labs for the first few weeks to ease the learning curve.
 - Details soon
 - Wed 4-7pm is the most likely candidate.

COMP3231 04s1

11

Plagiarism

- We take cheating seriously!!!
- Penalties include
 - Copying of code: 0 FL
 - Help with coding: negative half the assignment's max marks
 - Originator of a plagiarised solution: 0 for the particular assignment
 - Team work: 0 for the particular assignments

COMP3231 04s1

12

Cheating Statistics

Session	1998/S1	1999/S1	2000/S1	2001/S1	2001/S2	2002/S1	2002/S2	2003/S1	2003/S2
enrolment	178	410	320	300	107	298	156	333	133
suspected cheaters	10(6%)	26(6%)	22(7%)	28(9%)	20(19%)	15(5%)	???(?%)	13 (4%)	???(?%)
full penalties	2'	6'	9'	14'	10	9	5	2	1
reduced penalties	7	15	7	7	5	4	2	2	9
cheaters failed	4	10	16	16	10	12	5	4	?
cheaters suspended	0	0	1	0	0	1	0	0	0

*Note: Full penalty 0 FL not applied prior to 2001/S1
COMP3231 04s1

13

Exams

- There is NO mid-session
- The final written exam is 2 hours
- Supplementary exams are **oral**.
 - Supplementaries are available according to school policy, not as a second chance.

THE UNIVERSITY OF
NEW SOUTH WALES

COMP3231 04s1

14

Assessment

- Exam Mark Component
 - Max mark of 100
- Based solely on the final exam
- Class Mark Component
 - Max mark of 100
- 10% tutorial participation
- 90% Assignments

THE UNIVERSITY OF
NEW SOUTH WALES

COMP3231 04s1

15

Assessment

- The final assessment is the harmonic mean of the exam and class component.
- If $C \geq 40$, and $E \geq 40$

$$M = \frac{2EC}{E + C}$$

THE UNIVERSITY OF
NEW SOUTH WALES

COMP3231 04s1

16

Assessment

- If $C < 40$ or $E < 40$

$$M = \min\left(44, \frac{2EC}{E + C}\right)$$

THE UNIVERSITY OF
NEW SOUTH WALES

COMP3231 04s1

17

Harmonic Mean

THE UNIVERSITY OF
NEW SOUTH WALES

COMP3231 04s1

19

Harmonic Mean

Assessment

- You need to perform reasonably consistently in both exam and class components.
- Harmonic mean only has significant effect with significant variation.

Textbook

Consultations/Questions

- Email your questions to cs3231@cse.unsw.edu.au
 - Expect a 24 hr turn-around time.
 - We reserve the right to ignore email sent directly to us.
- Consultation Times
 - Kevin Elphinstone: Tuesday 10-11am, venue TBA
 - Please phone me if I'm not there.
 - Cameron Stone: TBA, venue TBA

Introduction to Operating Systems

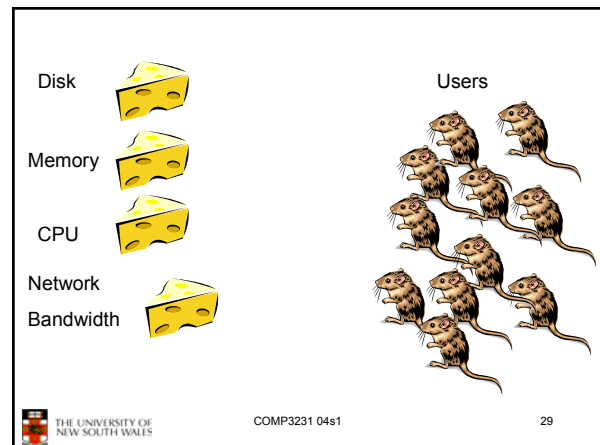

Chapter 1 – 1.3

What is an Operating System?

Viewing the Operating System as an Abstract Machine

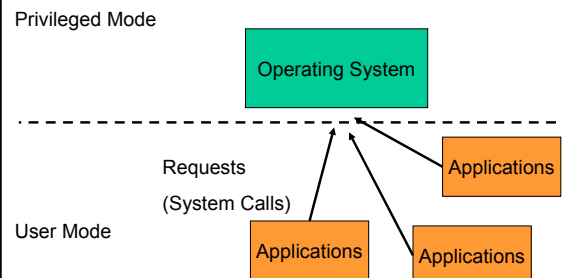

- Extends the basic hardware with added functionality
- Provides high-level abstractions
 - More programmer friendly
 - Common core for all applications
- It hides the details of the hardware
 - Makes application code portable

Viewing the Operating System as a Resource Manager

- Responsible for allocating resources to users and processes
- Must ensure
 - No Starvation
 - Progress
 - Allocation is according to some desired policy
 - First-come, first-served; Fair share; Weighted fair share; limits (quotas), etc...
 - Overall, that the system is efficiently used

Viewing the Operating System as the Privileged Component

The Operating System is Privileged

- Applications should not be able to interfere or bypass the operating system
 - OS can enforce the “extend machine”
 - OS can enforce its resource allocation policies
 - Prevent applications from interfering with each other
- Note: Some Embedded OSs have no privileged component, e.g. PalmOS
 - Can implement OS functionality, but cannot enforce it.

Why Study Operating Systems?

- There are many interesting problems in operating systems.
- For a complete, top-to-bottom view of a system.
- Understand performance implications of application behaviour.
- Understanding and programming large, complex, software systems is a good skill to acquire.

(A brief) Operating System History

- Largely parallels hardware development
- First Generation machines
 - Vacuum tubes
 - Plug boards
 - Programming via wiring
 - Users were simultaneously designers, engineers, and programmers
 - “single user”
 - difficult to debug (hardware)
 - No Operating System

Examining a hot tube mount checking among ENIAC's 18000 positions.

Second Generation Machines Batch Systems

- IBM 7094
 - 0.35 MIPS, 32K x 36-bit memory
 - 3.5 million dollars
- Batching used to more efficiently use the hardware
 - Share machine amongst many users
 - One at a time
 - Debugging a pain
 - Drink coffee until jobs finished

Batch System Operating Systems

- Sometimes called “resident job monitor”
- Managed the Hardware
- Simple Job Control Language (JCL)
 - Load compiler
 - Compile job
 - Run job
 - End job
- No resource allocation issues
 - “one user”

Problem: Keeping Batch Systems Busy

- Reading tapes or punch cards was time consuming
- Expensive CPU was idle waiting for input

Third Generation Systems - Multiprogramming

- Divided memory among several loaded jobs
- While one job is loading, CPU works on another
- With enough jobs, CPU 100% busy
- Needs special hardware to isolate memory partitions from each other
 - This hardware was notably absent on early 2nd gen. batch systems

Memory

Multiprogramming Example

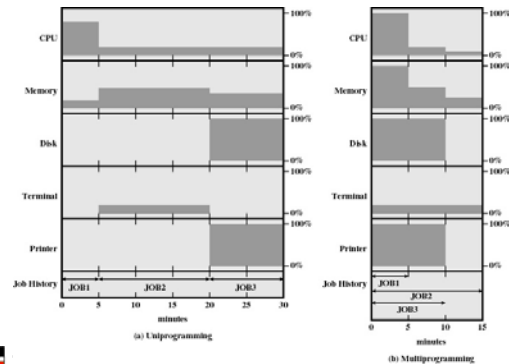

Figure 2.6 Utilization Histograms

Job turn-around time was still an issue.

- Batch systems were well suited to
 - Scientific calcs
 - Data processing
- For programmers, debugging was much easier on older first gen. machines as the programmer had the machine to himself.
- Word processing on a batch system?

Time sharing

- Each user had his/her own terminal connected to the machine
- All user's jobs were multiprogrammed
 - Regularly switch between each job
 - Do it fast
- Gives the illusion that the programmer has the machine to himself
- Early examples: Compatible Time Sharing System (CTSS), MULTICS

An then...

- Further developments (hardware and software) resulted in improved techniques, concepts, and operating systems.....
 - CAP, Hydra, Mach, UNIX V6, BSD UNIX, THE, Thoth, Sprite, Accent, UNIX SysV, Linux, EROS, KeyKOS, OS/360, VMS, HPUX, Apollo Domain, Nemesis, L3, L4, CP/M, DOS, Exo-kernel, Angel, Mungi, BE OS, Cache Kernel, Choices, V, Inferno, Grasshopper, MOSIX, Opal, SPIN, VINO, OS9, Plan/9, QNX, Synthetix, Tornado, x-kernel, VxWorks, Solaris.....

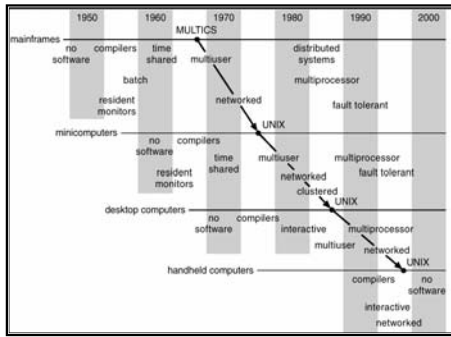

The Advent of the PC

- Large Scale Integration (LSI) made small, fast(-ish), cheap computers possible
- OSs followed a similar path as with the mainframes
 - Simple "single-user" systems (DOS)
 - Multiprogramming without protection, (80286 era, Window 3.1, 95, 98, ME, etc...)
 - "Real" operating systems (UNIX, WinNT, etc..)

Operating System Time Line

Computer Hardware Review

Chapter 1.4

Operating Systems

- Exploit the hardware available
- Provide a set of high-level services that represent or are implemented by the hardware.
- Manages the hardware reliably and efficiently
- *Understanding operating systems requires a basic understanding of the underlying hardware*

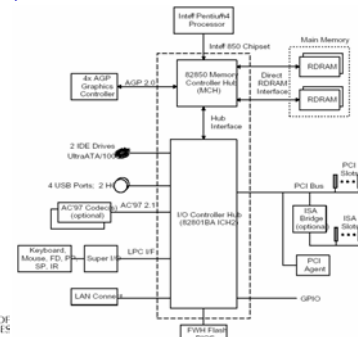

Basic Computer Elements

Basic Computer Elements

- CPU
 - Performs computations
 - Load data to/from memory via system bus
- Device controllers
 - Control operation of their particular device
 - Operate in parallel with CPU
 - Can also load/store to memory (Direct Memory Access, DMA)
 - Control register appear as memory locations to CPU
 - Or I/O ports
 - Signal the CPU with “interrupts”
- Memory Controller
 - Responsible for refreshing dynamic RAM
 - Arbitrating access between different devices and CPU

The real world is logically similar, but a little more complex

A Simple Model of CPU Computation

- The fetch-execute cycle

Figure 1.2 Basic Instruction Cycle

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 50

A Simple Model of CPU Computation

- Stack Pointer
 - Condition codes
 - Positive result
 - Zero result
 - Negative result
- General Purpose Registers
 - Holds operands of most instructions
 - Enables programmers to minimise memory references.

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 52

Privileged-mode Operation

- To protect operating system execution, two or more CPU modes of operation exist
 - Privileged mode (system-, kernel-mode)
 - All instructions and registers are available
 - User-mode
 - Uses 'safe' subset of the instruction set
 - E.g. no disable interrupts instruction
 - Only 'safe' registers are accessible

Interrupt Mask
Exception Type
MMU regs

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 53

'Safe' registers and instructions

- Registers and instructions are safe if
 - Only affect the state of the application itself
 - They cannot be used to uncontrollably interfere with
 - The operating system
 - Other applications
 - They cannot be used to violate a correctly implemented operating system policy.

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 54

Privileged-mode Operation

- The accessibility of addresses with an address space changes depending on operating mode
 - To protect kernel code and data

Accessible only to Kernel-mode
Accessible to User- and Kernel-mode

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 55

I/O and Interrupts

- I/O events (keyboard, mouse, incoming network packets) happen at unpredictable times
- Direct memory access (DMA)
 - I/O exchanges occur directly with memory
 - Processor directs I/O controller to read/write to memory
 - Relieves the processor of the responsibility for data transfer
 - Processor free to do other things
- How does the CPU know when to service an I/O event?

Interrupts

- An interruption of the normal sequence of execution
- A suspension of processing caused by an event external to that processing, and performed in such a way that the processing can be resumed.
- Improves processing efficiency
 - Allows the processor to execute other instructions while an I/O operation is in progress
 - Avoids unnecessary completion checking (polling)

Interrupt Cycle

- Processor checks for interrupts
- If no interrupts, fetch the next instruction
- If an interrupt is pending, divert to the interrupt handler

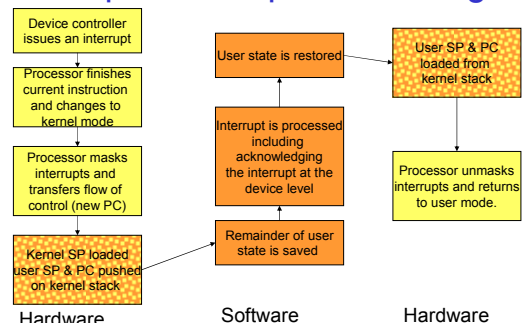

Classes of Interrupts

- Program exceptions (also called *synchronous interrupts*)
 - Arithmetic overflow
 - Division by zero
 - Executing an illegal/privileged instruction
 - Reference outside user's memory space.
- Asynchronous (external) events
 - Timer
 - I/O
 - Hardware or power failure

Interrupt Handler

- A program that determines the nature of the interrupt and performs whatever actions are needed.
- Control is transferred to the handler by *hardware*.
- The handler is generally part of the operating system.

Simple Interrupt Processing

Multiple Interrupts

- Sequential interrupts
 - Processor ignores any new interrupt signals
 - Interrupts remain pending until current interrupt completes
 - Upon completion, processor checks for additional interrupts

(a) Sequential interrupt processing
Figure 1.12 Transfer of Control with Multiple Interrupts

Multiple Interrupts

- Prioritised (nested) interrupts
 - Processor ignores any new lower-priority interrupt signals
 - New higher-priority interrupts interrupt the current interrupt handler
 - Example: when input arrive from a communication line, it needs to be absorbed quickly to make room for more input

(b) Nested interrupt processing
Figure 1.12 Transfer of Control with Multiple Interrupts

Programmed I/O

- Also called *polling*, or *busy waiting*
- I/O module (controller) performs the action, not the processor
- Sets appropriate bits in the I/O status register
- No interrupts occur
- Processor checks status until operation is complete
 - Wastes CPU cycles

(a) Programmed I/O

Interrupt-Driven I/O

- Processor is interrupted when I/O module (controller) ready to exchange data
- Processor is free to do other work
- No needless waiting
- Consumes a lot of processor time because every word read or written passes through the processor

(b) Interrupt-driven I/O

Direct Memory Access

- Transfers a block of data directly to or from memory
- An interrupt is sent when the task is complete
- The processor is only involved at the beginning and end of the transfer

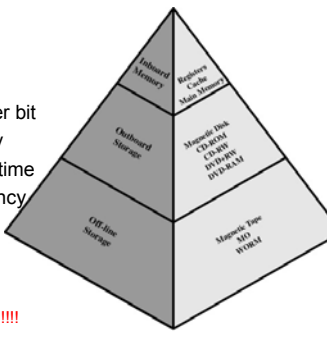

(c) Direct memory access

Multiprogramming (Multitasking)

- Processor has more than one program to execute.
 - Some tasks waiting for I/O to complete
 - Some tasks ready to run, but not running
- Interrupt handler can switch to other tasks when they become runnable
- Regular timer interrupts can be used for timesharing

Memory Hierarchy

- Going down the hierarchy
 - Decreasing cost per bit
 - Increasing capacity
 - Increasing access time
 - Decreasing frequency of access to the memory by the processor
 - Hopefully
 - Principle of locality!!!!**

THE UNIVERSITY OF NEW SOUTH WALES CC

Figure 1.14. The Memory Hierarchy

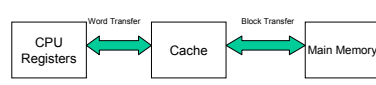

Memory Hierarchy

- Rough approximation of memory hierarchy

Typical access time		Typical capacity
1 nsec	Registers	<1 KB
2 nsec	Cache	1 MB
10 nsec	Main memory	64-512 MB
10 msec	Magnetic disk	5-50 GB
100 sec	Magnetic tape	20-100 GB

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 69

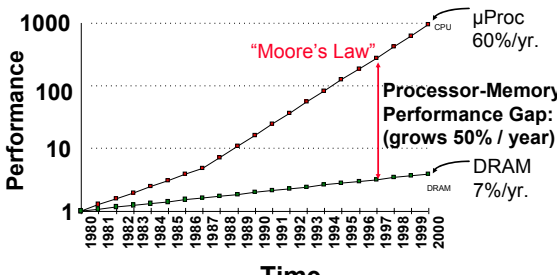

Cache

- Cache is fast memory placed between the CPU and main memory
 - 1 to a few cycles access time compared to RAM access time of tens – hundreds of cycles
- Holds recently used data or instructions to save memory accesses.
- Matches slow RAM access time to CPU speed if high hit rate
- (± 90%)
- Is hardware maintained and (mostly) transparent to software
- Sizes range from few kB to several MB.
- Usually a hierarchy of caches (2–5 levels), on- and off-chip.
- Block transfers can achieve higher transfer bandwidth than single words.

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 70

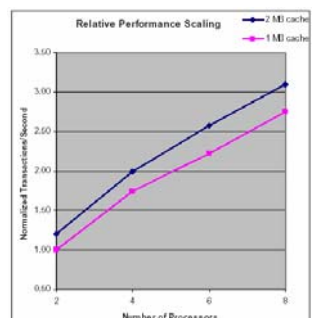

Processor-DRAM Gap (latency)

THE UNIVERSITY OF NEW SOUTH WALES COMP3231 04s1 71

Slide originally from Dave Patterson, Parson 98

Cache size affect on performance

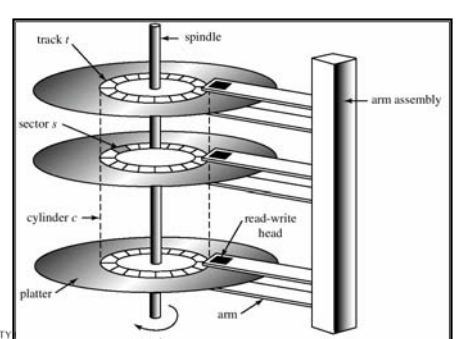

THE UNIVERSITY OF NEW SOUTH WALES

Figure 1 - OLTP Performance Improvement Between 1MB and 2MB Caches in a ProLiant 8500 Server

72

Moving-Head Disk Mechanism

THE UNIVERSITY OF NEW SOUTH WALES

Example Disk Access Times

- Disk can read/write data relatively fast
 - 15,000 rpm drive - 80 MB/sec
 - 1 KB block is read in 12 microseconds
- Access time dominated by time to locate the head over data
 - Rotational latency
 - Half one rotation is 2 milliseconds
 - Seek time
 - Full inside to outside is 8 milliseconds
 - Track to track .5 milliseconds
- 2 milliseconds is 164KB in “lost bandwidth”

A Strategy: Avoid Waiting for Disk Access

- Keep a subset of the disk's data in memory
- ⇒ Main memory acts as a *cache* of disk contents
