

System Calls

1

Learning Outcomes

- A high-level understanding of System Calls
 - Mostly from the user's perspective
 - From textbook (section 1.6)
- Exposure architectural details of the MIPS R3000
 - Detailed understanding of the exception handling mechanism
 - From "Hardware Guide" on class web site
- Understanding of the existence of compiler function calling conventions
 - Including details of the MIPS 'C' compiler calling convention
- Understanding of how the application kernel boundary is crossed with system calls in general
 - Including an appreciation of the relationship between a case study (OS/161 system call handling) and the general case.

2

Operating System System Calls

Kernel Level

User Level

3

System Calls

- Can be viewed as special function calls
 - Provides for a controlled entry into the kernel
 - While in kernel, they perform a privileged operation
 - Returns to original caller with the result
- The system call interface represents the abstract machine provided by the operating system.

4

A Brief Overview of Classes System Calls

- From the user's perspective
 - Process Management
 - File I/O
 - Directories management
 - Some other selected Calls
 - There are many more
 - On Linux, see `man syscalls` for a list

5

Some System Calls For Process Management

Process management	
Call	Description
<code>pid = fork()</code>	Create a child process identical to the parent
<code>pid = waitpid(pid, &statloc, options)</code>	Wait for a child to terminate
<code>s = execve(name, argv, environp)</code>	Replace a process' core image
<code>exit(status)</code>	Terminate process execution and return status

6

Some System Calls For File Management

File management

Call	Description
fd = open(file, how, ...)	Open a file for reading, writing or both
s = close(fd)	Close an open file
n = read(fd, buffer, nbytes)	Read data from a file into a buffer
n = write(fd, buffer, nbytes)	Write data from a buffer into a file
position = lseek(fd, offset, whence)	Move the file pointer
s = stat(name, &buf)	Get a file's status information

7

Some System Calls For Directory Management

Directory and file system management

Call	Description
s = mkdir(name, mode)	Create a new directory
s = rmdir(name)	Remove an empty directory
s = link(name1, name2)	Create a new entry, name2, pointing to name1
s = unlink(name)	Remove a directory entry
s = mount(special, name, flag)	Mount a file system
s = umount(special)	Unmount a file system

8

Some System Calls For Miscellaneous Tasks

Miscellaneous

Call	Description
s = chdir(dirname)	Change the working directory
s = chmod(name, mode)	Change a file's protection bits
s = kill(pid, signal)	Send a signal to a process
seconds = time(&seconds)	Get the elapsed time since Jan. 1, 1970

9

System Calls

- A stripped down shell:

```

while (TRUE) {
    type_prompt();
    read_command(command, parameters)
    /* repeat forever */
    /* display prompt */
    /* input from terminal */

    if (fork() != 0) {
        /* Parent code */
        waitpid(-1, &status, 0);
        /* fork off child process */
    } else {
        /* Child code */
        execve(command, parameters, 0);
        /* wait for child to exit */
        /* execute command */
    }
}

```

10

System Calls

UNIX	Win32	Description
fork	CreateProcess	Create a new process
waitpid	WaitForSingleObject	Can wait for a process to exit
execve	(none)	CreateProcess = fork + execve
exit	ExitProcess	Terminate execution
open	CreateFile	Create a file or open an existing file
close	CloseHandle	Close a file
read	ReadFile	Read data from a file
write	WriteFile	Write data to a file
lseek	SetFilePointer	Move the file pointer
stat	GetFileAttributesEx	Get various file attributes
mkdir	CreateDirectory	Create a new directory
rmdir	RemoveDirectory	Remove an empty directory
link	(none)	Win32 does not support links
unlink	DeleteFile	Destroy an existing file
mount	(none)	Win32 does not support mount
umount	(none)	Win32 does not support mount
chdir	SetCurrentDirectory	Change the current working directory
chmod	(none)	Win32 does not support security (although NT does)
kill	(none)	Win32 does not support signals
time	GetLocalTime	Get the current time

Some Win32 API calls

11

The MIPS R2000/R3000

- Before looking at system call mechanics in some detail, we need a basic understanding of the MIPS R3000

12

MIPS R3000

- Load/store architecture
 - No instructions that operate on memory except load and store
 - Simple load/stores to/from memory from/to registers
 - Store word: **sw r4, (r5)**
 - Store contents of r4 in memory using address contained in register r5
 - Load word: **lw r3, (r7)**
 - Load contents of memory into r3 using address contained in r7
 - Delay of one instruction after load before data available in destination register
 - » Must always be an instruction between a load from memory and the subsequent use of the register.
 - **lw, sw, lb, sb, lh, sh, ...**

13

MIPS R3000

- Arithmetic and logical operations are register to register operations
 - E.g., **add r3, r2, r1**
 - No arithmetic operations on memory
- Example
 - **add r3, r2, r1** $\Rightarrow r3 = r2 + r1$
- Some other instructions
 - **add, sub, and, or, xor, sll, srl**
 - **move r2, r1** $\Rightarrow r2 = r1$

14

MIPS R3000

- All instructions are encoded in 32-bit
- Some instructions have *immediate* operands
 - Immediate values are constants encoded in the instruction itself
 - Only 16-bit value
 - Examples
 - Add Immediate: **addi r2, r1, 2048**
 $\Rightarrow r2 = r1 + 2048$
 - Load Immediate : **li r2, 1234**
 $\Rightarrow r2 = 1234$

15

Example code

Simple code example: **a = a + 1**

```
lw    r4, 32(r29)      // r29 = stack pointer
li    r5, 1
add  r4, r4, r1
sw    r4, 32(r29)
```

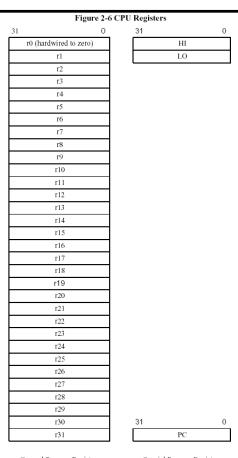

Offset(Address)

16

MIPS Registers

- User-mode accessible registers
 - 32 general purpose registers
 - r0 hardwired to zero
 - r31 the *link* register for jump-and-link (JAL) instruction
 - HI/LO
 - 2 * 32-bits for multiply and divide
 - PC
 - Not directly visible
 - Modified implicitly by jump and branch instructions

Branching and Jumping

- Branching and jumping have a *branch delay slot*
 - The instruction following a branch or jump is always executed prior to destination of jump

18

MIPS R3000

- RISC architecture – 5 stage pipeline
 - Instruction partially through pipeline prior to jmp having an effect

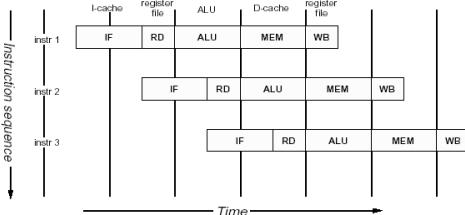

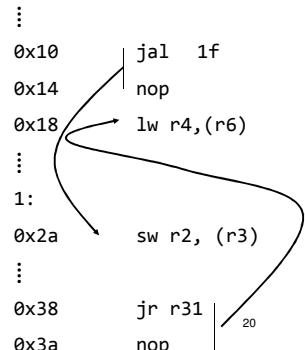

Figure 1.1. MIPS 5-stage pipeline

19

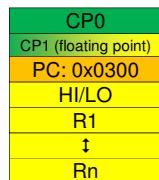

Jump and Link Instruction

- JAL is used to implement function calls
 - $r31 = PC+8$
- Return Address register (RA) is used to return from function call

Coprocessor 0

- The processor control registers are located in CP0
 - Exception/Interrupt management registers
 - Translation management registers
- CP0 is manipulated using mtc0 (move to) and mfc0 (move from) instructions
 - mtc0/mfc0 are only accessible in kernel mode.

21

CP0 Registers

- Exception Management
 - c0_cause
 - Cause of the recent exception
 - c0_status
 - Current status of the CPU
 - c0_epc
 - Address of the instruction that caused the exception
 - c0_badvaddr
 - Address accessed that caused the exception
- Miscellaneous
 - c0_prid
 - Processor Identifier
- Memory Management
 - c0_index
 - c0_random
 - c0_entryhi
 - c0_entrylo
 - c0_context

22

c0_status

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CU3	CU2	CU1	CU0	0	RE	0	BEV	TS	PE	CM	PZ	SwC	IsC		
15				8	7	6	5	4	3	2	1	0			
	IM			0	KUo	IEno	KUp	IEp	KUc	IEc					

Figure 3.2. Fields in status register (SR)

- For practical purposes, you can ignore most bits
 - Green background is the focus

23

c0_status

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CU3	CU2	CU1	CU0	0	RE	0	BEV	TS	PE	CM	PZ	SwC	IsC		
15				8	7	6	5	4	3	2	1	0			
	IM			0	KUo	IEno	KUp	IEp	KUc	IEc					

Figure 3.2. Fields in status register (SR)

- IM
 - Individual interrupt mask bits
 - 6 external
 - 2 software
- KU
 - 0 = kernel
 - 1 = user mode
- IE
 - 0 = all interrupts masked
 - 1 = interrupts enable
 - Mask determined via IM bits
- c, p, o = current, previous, old

24

c0_cause

31	30	29	28	27	16	15	8	7	6	2	1	0
BD	0	CE	0		IP	0	ExcCode	0				

Figure 3.3. Fields in the Cause register

- IP
 - Interrupts pending
 - 8 bits indicating current state of interrupt lines
- CE
 - Coprocessor error
 - Attempt to access disabled Copro.
- BD
 - If set, the instruction that caused the exception was in a branch delay slot
- ExcCode
 - The code number of the exception taken

THE UNIVERSITY OF NEW SOUTH WALES

Exception Codes

ExcCode Value	Mnemonic	Description
0	Int	Interrupt
1	Mod	"TLB modification"
2	TLBL	"TLB load/TLB store"
3	TLBS	
4	AdEL	Address error (on load/I-fetch or store respectively). Either an attempt to access outside kuseg when in user mode, or an attempt to read a word or half-word at a misaligned address.
5	AdES	

Table 3.2. ExcCode values: different kinds of exceptions

THE UNIVERSITY OF NEW SOUTH WALES

Exception Codes

ExcCode Value	Mnemonic	Description
6	IBE	Bus error (instruction fetch or data load, respectively). External hardware has signalled an error of some kind; proper exception handling is system-dependent. The R30xx family CPUs can't take a bus error on a store; the write buffer would make such an exception "imprecise".
7	DBE	
8	Syscall	Generated unconditionally by a <i>syscall</i> instruction.
9	Bp	Breakpoint - a break instruction.
10	RI	"reserved instruction"
11	CpU	"Co-Processor unusable"
12	Ov	"arithmetic overflow". Note that "unsigned" versions of instructions (e.g. <i>addiu</i>) never cause this exception.
13-31	-	reserved. Some are already defined for MIPS CPUs such as the R6000 and R4xxx

Table 3.2. ExcCode values: different kinds of exceptions

THE UNIVERSITY OF NEW SOUTH WALES

c0_epc

- The Exception Program Counter
 - Points to address of where to restart execution after handling the exception or interrupt
 - Example
 - Assume `sw r3, (r4)` causes a restartable fault exception

Aside: We are ignore BD-bit in c0_cause which is also used in reality on rare occasions.

THE UNIVERSITY OF NEW SOUTH WALES

Exception Vectors

Program address	"segment"	Physical Address	Description
0x8000 0000	kseg0	0x0000 0000	TLB miss on kuseg reference only.
0x8000 0080	kseg0	0x0000 0080	All other exceptions.
0xbfc0 0100	kseg1	0x1fce0 0100	Uncached alternative kuseg TLB miss entry point (used if SR bit BEV set).
0xbfc0 0180	kseg1	0x1fce0 0180	Uncached alternative for all other exceptions, used if SR bit BEV set.
0xbfc0 0000	kseg1	0x1fce0 0000	The "reset exception".

Table 4.1. Reset and exception entry points (vectors) for R30xx family

THE UNIVERSITY OF NEW SOUTH WALES

Simple Exception Walk-through

User Mode

Kernel Mode

Application

Interrupt Handler

THE UNIVERSITY OF NEW SOUTH WALES

Hardware exception handling

- PC
0x12345678
- EPC
?
- Cause
- | | | | | | |
|-----|-----|-----|-----|-----|-----|
| ? | ? | ? | ? | 1 | 1 |
| KUo | IEo | KUp | IEp | KUc | IEc |
- Let's now walk through an exception
 - Assume an interrupt occurred as the previous instruction completed
 - Note: We are in user mode with interrupts enabled

31

Hardware exception handling

- PC
0x12345678
- EPC
0x12345678
- Cause
- | | | | | | |
|-----|-----|-----|-----|-----|-----|
| ? | ? | ? | ? | 1 | 1 |
| KUo | IEo | KUp | IEp | KUc | IEc |
- Instruction address at which to restart after the interrupt is transferred to EPC

32

Hardware exception handling

- PC
0x12345678
- Status
KUo IEo KUp IEp KUc IEc
- Interruptions disabled and previous state shifted along
- Kernel Mode is set, and previous mode shifted along

33

Hardware exception handling

- PC
0x12345678
- EPC
0x12345678
- Cause
- | | | | | | |
|-----|-----|-----|-----|-----|-----|
| 0 | ? | ? | ? | 1 | 0 |
| KUo | IEo | KUp | IEp | KUc | IEc |
- Code for the exception placed in Cause. Note Interrupt code = 0

34

Hardware exception handling

- PC
0x80000080
- EPC
0x12345678
- Cause
- | | | | | | |
|-----|-----|-----|-----|-----|-----|
| 0 | ? | ? | ? | 1 | 0 |
| KUo | IEo | KUp | IEp | KUc | IEc |
- Address of general exception vector placed in PC

35

Hardware exception handling

- PC
0x80000080
- EPC
0x12345678
- Cause
- | | | | | | |
|-----|-----|-----|-----|-----|-----|
| 0 | ? | ? | ? | 1 | 0 |
| KUo | IEo | KUp | IEp | KUc | IEc |
- Badvaddr
- CPU is now running in kernel mode at 0x80000080, with interrupts disabled
 - All information required to
 - Find out what caused the exception
 - Restart after exception handling
 - is in coprocessor registers

36

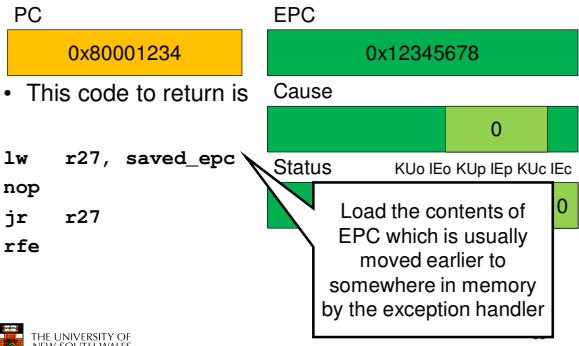

Returning from an exception

- For now, let's ignore
 - how the exception is actually handled
 - how user-level registers are preserved
- Let's simply look at how we return from the exception

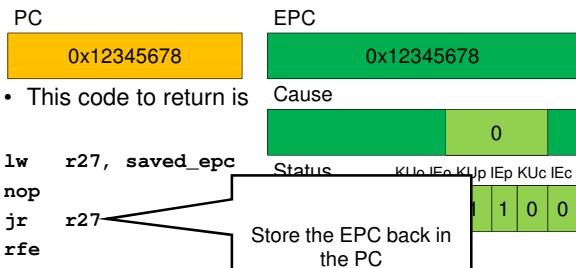

37

Returning from an exception

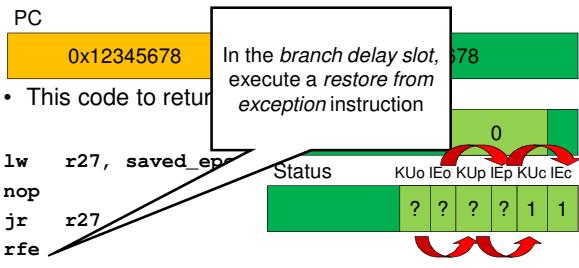

37

Returning from an exception

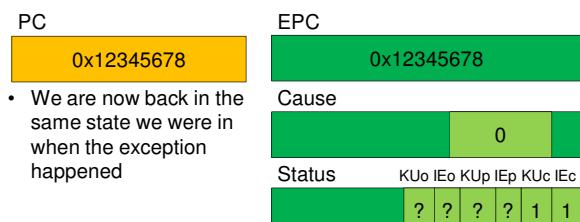

39

Returning from an exception

40

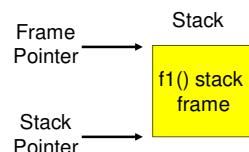

Returning from an exception

41

Function Stack Frames

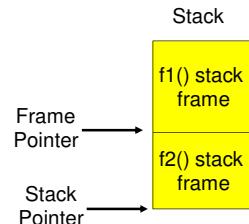

- Each function call allocates a new stack frame for local variables, the return address, previous frame pointer etc.
 - Frame pointer: start of current stack frame
 - Stack pointer: end of current stack frame
- Example: assume f1() calls f2(), which calls f3().

42

Function Stack Frames

- Each function call allocates a new stack frame for local variables, the return address, previous frame pointer etc.
 - Frame pointer: start of current stack frame
 - Stack pointer: end of current stack frame
- Example: assume f1() calls f2(), which calls f3().

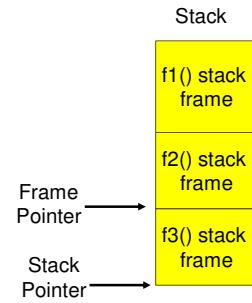

THE UNIVERSITY OF
NEW SOUTH WALES

43

Function Stack Frames

- Each function call allocates a new stack frame for local variables, the return address, previous frame pointer etc.
 - Frame pointer: start of current stack frame
 - Stack pointer: end of current stack frame
- Example: assume f1() calls f2(), which calls f3().

44

Compiler Register Conventions

- Given 32 registers, which registers are used for
 - Local variables?
 - Argument passing?
 - Function call results?
 - Stack Pointer?

THE UNIVERSITY OF
NEW SOUTH WALES

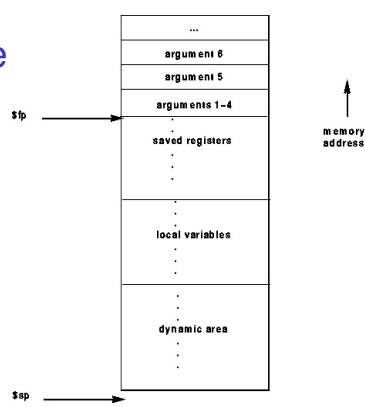

45

Compiler Register Conventions

Reg No	Name	Used for
0	zero	Always returns 0
1	at	(assembler temporary) Reserved for use by assembler
2-3	v0-v1	Value (except FP) returned by subroutine
4-7	a0-a3	(arguments) First four parameters for a subroutine
8-15	t0-t7	(temporaries) Subroutines may use without saving
24-25	t8-t9	
16-23	s0-s7	Subroutine "register variables": a subroutine which will write one of these must save the old value and restore it before it exits, so the calling routine sees their values preserved.
26-27	k0-k1	Reserved for use by interrupt/trap handler - may change under your feet
28	gp	global pointer - some runtime systems maintain this to give easy access to (some) "static" or "extern" variables.
29	sp	stack pointer
30	s8/fp	9th register variable. Subroutines which need one can use this as a "frame pointer".
31	ra	Return address for subroutine

Stack Frame

- MIPS calling convention for gcc
 - Args 1-4 have space reserved for them

47

Example Code

```

main ()
{
    int i;
    int a, b, c, d, e, f;
    a = sixargs(1, 2, 3, 4, 5, 6);
    b = sixargs(1, 2, 3, 4, 5, 6);
    c = sixargs(1, 2, 3, 4, 5, 6);
    d = sixargs(1, 2, 3, 4, 5, 6);
    e = sixargs(1, 2, 3, 4, 5, 6);
    f = sixargs(1, 2, 3, 4, 5, 6);
    i = a + b + c + d + e + f;
}
  
```

```

51

System Calls

Continued

52

User and Kernel Execution

- Simplistically, CPU execution state consists of
 - Registers, processor mode, PC, SP
- User applications and the kernel have their own execution state.
- System call mechanism safely transfers from user execution to kernel execution and back.

53

System Call Mechanism in Principle

- Processor mode
 - Switched from user-mode to kernel-mode
 - Switched back when returning to user mode
- SP
 - User-level SP is saved and a kernel SP is initialised
 - User-level SP restored when returning to user-mode
- PC
 - User-level PC is saved and PC set to kernel entry point
 - User-level PC restored when returning to user-level
 - Kernel entry via the designated entry point must be strictly enforced

54

System Call Mechanism in Principle

- Registers
 - Set at user-level to indicate system call type and its arguments
 - A convention between applications and the kernel
 - Some registers are preserved at user-level or kernel-level in order to restart user-level execution
 - Depends on language calling convention etc.
 - Result of system call placed in registers when returning to user-level
 - Another convention

55

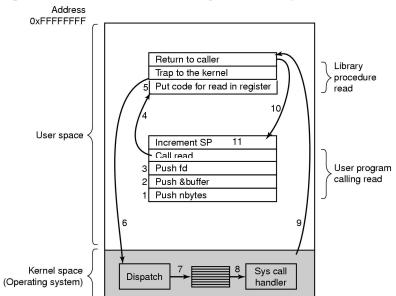

Why do we need system calls?

- Why not simply jump into the kernel via a function call????
- Function calls do not
 - Change from user to kernel mode
 - and eventually back again
 - Restrict possible entry points to secure locations

56

Steps in Making a System Call

There are 11 steps in making the system call
read(fd, buffer, nbytes)

MIPS System Calls

- System calls are invoked via a *syscall* instruction.
 - The *syscall* instruction causes an exception and transfers control to the general exception handler
 - A convention (an agreement between the kernel and applications) is required as to how user-level software indicates
 - Which system call is required
 - Where its arguments are
 - Where the result should go

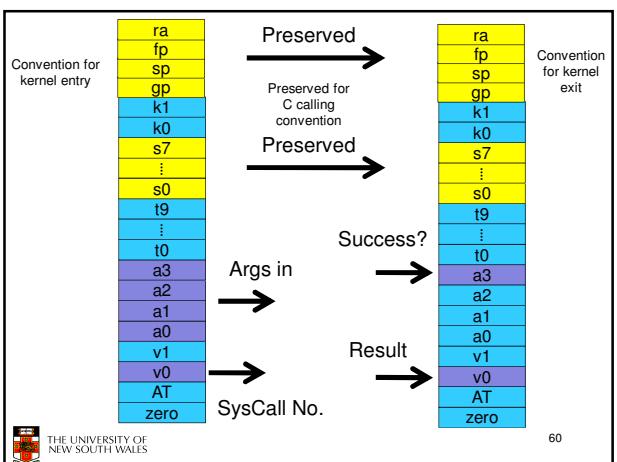

58

OS/161 Systems Calls

- OS/161 uses the following conventions
 - Arguments are passed and returned via the normal C function calling convention
 - Additionally
 - Reg v0 contains the system call number
 - On return, reg a3 contains
 - 0: if success, v0 contains successful result
 - not 0: if failure, v0 has the errno.
 - v0 stored in errno
 - 1 returned in v0

59

60

CAUTION

- Seriously low-level code follows
- This code is not for the faint hearted

61

User-Level System Call Walk Through – Calling read()

`int read(int filehandle, void *buffer, size_t size)`

- Three arguments, one return value
- Code fragment calling the read function

```
400124: 02602021 move a0,s3
400128: 27a50010 addiu a1,sp,16
40012c: 0c1001a3 jal 40068c <read>
400130: 24060400 li a2,1024
400134: 00408021 move s0,v0
400138: 1a000016 blez s0,400194 <docat+0x94>
```

- Args are loaded, return value is tested

62

Inside the read() syscall function part 1

```
0040068c <read>:
40068c: 08100190 j 400640 <__syscall>
400690: 24020005 li v0,5
```

- Appropriate registers are preserved
 - Arguments (a0-a3), return address (ra), etc.
- The syscall number (5) is loaded into v0
- Jump (not jump and link) to the common syscall routine

63

The read() syscall function part 2

Generate a syscall exception

```
00400640 <__syscall>:
400640: 0000000c syscall
400644: 10e00005 beqz a3,40065c <__syscall+0x1c>
400648: 00000000 nop
40064c: 3c011000 lui at,0x1000
400650: ac220000 sw v0,0(at)
400654: 2403ffff li v1,-1
400658: 2402ffff li v0,-1
40065c: 03e00008 jr ra
400660: 00000000 nop
```

64

The read() syscall function part 2

Test success, if yes, branch to return from function

```
00400640 <__syscall>:
400640: 0000000c syscall

400660: 00000000    nop
```

Return to location after where read() was called

68

Summary

- From the caller's perspective, the read() system call behaves like a normal function call
 - It preserves the calling convention of the language
- However, the actual function implements its own convention by agreement with the kernel
 - Our OS/161 example assumes the kernel preserves appropriate registers(s0-s8, sp, gp, ra).
- Most languages have similar *libraries* that interface with the operating system.

69

System Calls - Kernel Side

- Things left to do
 - Change to kernel stack
 - Preserve registers by saving to memory (on the kernel stack)
 - Leave saved registers somewhere accessible to
 - Read arguments
 - Store return values
 - Do the "read()"
 - Restore registers
 - Switch back to user stack
 - Return to application

70

```
exception:
move k1, sp           /* Save previous stack pointer in k1 */
mfco k0, c0_status   /* Get status register */
andi k0, k0, CST_Up /* Check the we-were-in-user-mode bit */
beq k0, $0, 1f /* If clear, from kernel, already have stack */
nop                /* delay slot */

/* Coming from user mode
la k0, curkstack
lw sp, 0(k0)
nop

1:
mfco k0, c0_cause   /* Now, load the exception cause. */
j common_exception
nop                /* delay slot */
```

Note k0, k1 registers available for kernel use

71

```
exception:
move k1, sp           /* Save previous stack pointer in k1 */
mfco k0, c0_status   /* Get status register */
andi k0, k0, CST_Up /* Check the we-were-in-user-mode bit */
beq k0, $0, 1f /* If clear, from kernel, already have stack */
nop                /* delay slot */

/* Coming from user mode - load kernel stack into sp */
la k0, curkstack    /* get address of "curkstack" */
lw sp, 0(k0)         /* get its value */
nop                /* delay slot for the load */

1:
mfco k0, c0_cause   /* Now, load the exception cause. */
j common_exception
nop                /* delay slot */
```

72

```
common_exception:
```

```
/*  
 * At this point:  
 *     Interrupts are off. (The processor did this for us.)  
 *     k0 contains the exception cause value.  
 *     k1 contains the old stack pointer.  
 *     sp points into the kernel stack.  
 *     All other registers are untouched.  
 */  
  
/*  
 * Allocate stack space for 37 words to hold the trap frame,  
 * plus four more words for a minimal argument block.  
 */  
  
addi sp, sp, -164
```

73

```
/* The order here must match mips/include/trapframe.h. */
```

```
sw ra, 160(sp)      /* dummy for gdb */  
sw s8, 156(sp)      /* save s8 */  
sw sp, 152(sp)      /* dummy for gdb */  
sw gp, 148(sp)      /* save gp */  
sw k1, 144(sp)      /* dummy for gdb */  
sw k0, 140(sp)      /* dummy for gdb */  
  
sw k1, 152(sp)      /* real saved sp */  
nop                /* delay slot for store */  
  
mfco k1, c0_epc    /* Copr.0 reg 13 == PC for  
sw k1, 160(sp)      /* real saved PC */
```

These six stores are a "hack" to avoid confusing GDB. You can ignore the details of why and how.

74

```
/* The order here must match mips/include/trapframe.h. */
```

```
sw ra, 160(sp)      /* dummy for gdb */  
sw s8, 156(sp)      /* save s8 */  
sw sp, 152(sp)      /* dummy for gdb */  
sw gp, 148(sp)      /* save gp */  
sw k1, 144(sp)      /* dummy for gdb */  
sw k0, 140(sp)      /* dummy for gdb */  
  
sw k1, 152(sp)      /* real saved sp */  
nop                /* delay slot for store */  
  
mfco k1, c0_epc    /* Copr.0 reg 13 == PC for exception */  
sw k1, 160(sp)      /* real saved PC */
```

The real work starts here

75

```
sw t9, 136(sp)  
sw t8, 132(sp)  
sw s7, 128(sp)  
sw s6, 124(sp)  
sw s5, 120(sp)  
sw s4, 116(sp)  
sw s3, 112(sp)  
sw s2, 108(sp)  
sw s1, 104(sp)  
sw s0, 100(sp)  
sw t7, 96(sp)  
sw t6, 92(sp)  
sw t5, 88(sp)  
sw t4, 84(sp)  
sw t3, 80(sp)  
sw t2, 76(sp)  
sw t1, 72(sp)  
sw t0, 68(sp)  
sw a3, 64(sp)  
sw a2, 60(sp)  
sw a1, 56(sp)  
sw a0, 52(sp)  
sw v1, 48(sp)  
sw v0, 44(sp)  
sw AT, 40(sp)  
sw ra, 36(sp)
```

Save all the registers on the kernel stack

76

```
/*  
 * Save special registers.  
 */  
mfhi t0  
mflo t1  
sw t0, 32(sp)  
sw t1, 28(sp)  
  
/*  
 * Save remaining exception context information.  
 */  
  
sw k0, 24(sp)          /* k0 was loaded with cause earlier */  
mfco t1, c0_status     /* Copr.0 reg 11 == status */  
sw t1, 20(sp)  
mfco t2, c0_vaddr      /* Copr.0 reg 8 == faulting vaddr */  
sw t2, 16(sp)  
  
/*  
 * Pretend to save $0 for gdb's benefit.  
 */  
sw $0, 12(sp)
```

We can now use the other registers (t0, t1) that we have preserved on the stack

77

```
/*  
 * Prepare to call mips_trap(struct trapframe *)  
 */  
  
addiu a0, sp, 16      /* set argument */  
jal mips_trap         /* call it */  
nop                  /* delay slot */
```

Create a pointer to the base of the saved registers and store in the first argument register

78

```

struct trapframe {
    u_int32_t tf_vaddr;           /* vaddr register */
    u_int32_t tf_status;          /* status register */
    u_int32_t tf_cause;           /* cause register */
    u_int32_t tf_t0;
    u_int32_t tf_hi;
    u_int32_t tf_ra; /* Saved register 31 */
    u_int32_t tf_at; /* Saved register 1 (AT) */
    u_int32_t tf_v0; /* Saved register 2 (v0) */
    u_int32_t tf_v1; /* etc. */
    u_int32_t tf_a0;
    u_int32_t tf_a1;
    u_int32_t tf_a2;
    u_int32_t tf_a3;
    u_int32_t tf_t0;
    ...
    u_int32_t tf_t7;
    u_int32_t tf_t8;
    u_int32_t tf_t9;
    u_int32_t tf_k0; /* dummy (see exception.S comment) */
    u_int32_t tf_k1; /* dummy */
    u_int32_t tf_gp;
    u_int32_t tf_sp;
    u_int32_t tf_a8;
    u_int32_t tf_epc;
    /* coprocessor 0 epc register */
};

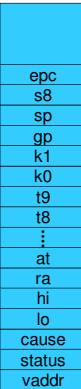

THE UNIVERSITY OF  
NEW SOUTH WALES

```

By creating a pointer to here of type struct trapframe *, we can access the user's saved registers as normal variables within 'C'

79

Kernel Stack

Now we arrive in the 'C' kernel

```

/*
 * General trap (exception) handling function for mips.
 * This is called by the assembly-language exception handler once
 * the trapframe has been set up.
 */
void
mips_trap(struct trapframe *tf)
{
    u_int32_t code, isutlb, iskern;
    int savespl;

    /* The trap frame is supposed to be 37 registers long. */
    assert(sizeof(struct trapframe)==(37*4));

    /* Save the value of curspl, which belongs to the old context. */
    savespl = curspl;

    /* Right now, interrupts should be off. */
    curspl = SPL_HIGH;
}

THE UNIVERSITY OF  
NEW SOUTH WALES

```

80

What happens next?

- The kernel deals with whatever caused the exception
 - Syscall
 - Interrupt
 - Page fault
 - It potentially modifies the *trapframe*, etc
 - E.g., Store return code in v0, zero in a3
- 'mips_trap' eventually returns

81

exception_return:

```

/*      16(sp)          no need to restore tf_vaddr */
lw t0, 20(sp)          /* load status register value into t0 */
nop                   /* load delay slot */
mtc0 t0, c0_status    /* store it back to coprocessor 0 */
/*      24(sp)          no need to restore tf_cause */

/* restore special registers */
lw t1, 28(sp)
lw t0, 32(sp)
mtl0 t1
mthi t0

/* load the general registers */
lw ra, 36(sp)

lw AT, 40(sp)
lw v0, 44(sp)
lw v1, 48(sp)
lw a0, 52(sp)
lw a1, 56(sp)
lw a2, 60(sp)
lw a3, 64(sp)

```

82

```

lw t0, 68(sp)
lw t1, 72(sp)
lw t2, 76(sp)
lw t3, 80(sp)
lw t4, 84(sp)
lw t5, 88(sp)
lw t6, 92(sp)
lw t7, 96(sp)
lw s0, 100(sp)
lw s1, 104(sp)
lw s2, 108(sp)
lw s3, 112(sp)
lw s4, 116(sp)
lw s5, 120(sp)
lw s6, 124(sp)
lw s7, 128(sp)
lw t8, 132(sp)
lw t9, 136(sp)

/*      140(sp)          "saved" k0 was dummy garbage anyway */
/*      144(sp)          "saved" k1 was dummy garbage anyway */

```

83

```

lw gp, 148(sp)          /* restore gp */
/*      152(sp)          stack pointer - below */
lw s8, 156(sp)          /* restore s8 */
lw k0, 160(sp)          /* fetch exception return PC into k0 */

lw sp, 152(sp)          /* fetch saved sp (must be last) */

/* done */
