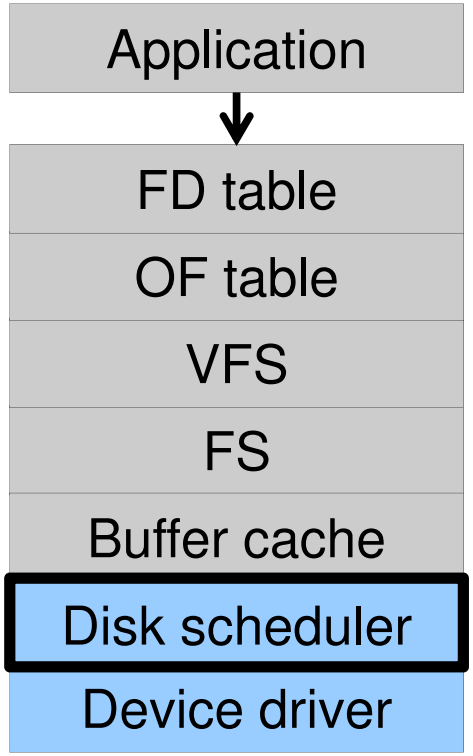
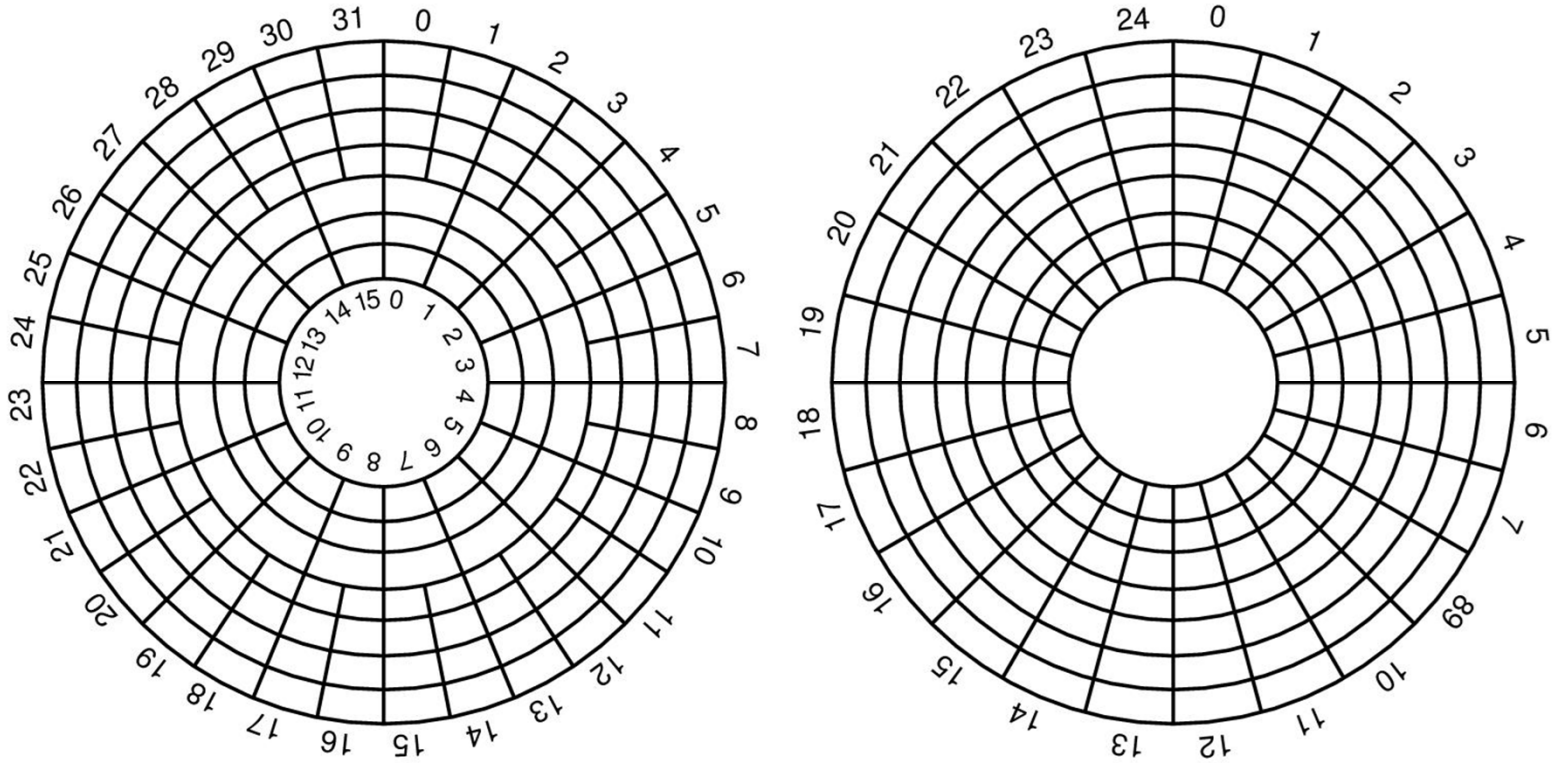
Disk scheduler



Disk Management

- Management and ordering of disk access requests is important:
  - Huge speed gap between memory and disk
  - Disk throughput is extremely sensitive to
    - Request order $\Rightarrow$ Disk Scheduling
    - Placement of data on the disk $\Rightarrow$ file system design
  - Disk scheduler must be aware of *disk geometry*

Disk Geometry



- Physical geometry of a disk with two zones
  - –Outer tracks can store more sectors than inner without exceed max information density
- A possible virtual geometry for this disk

Evolution of Disk Hardware

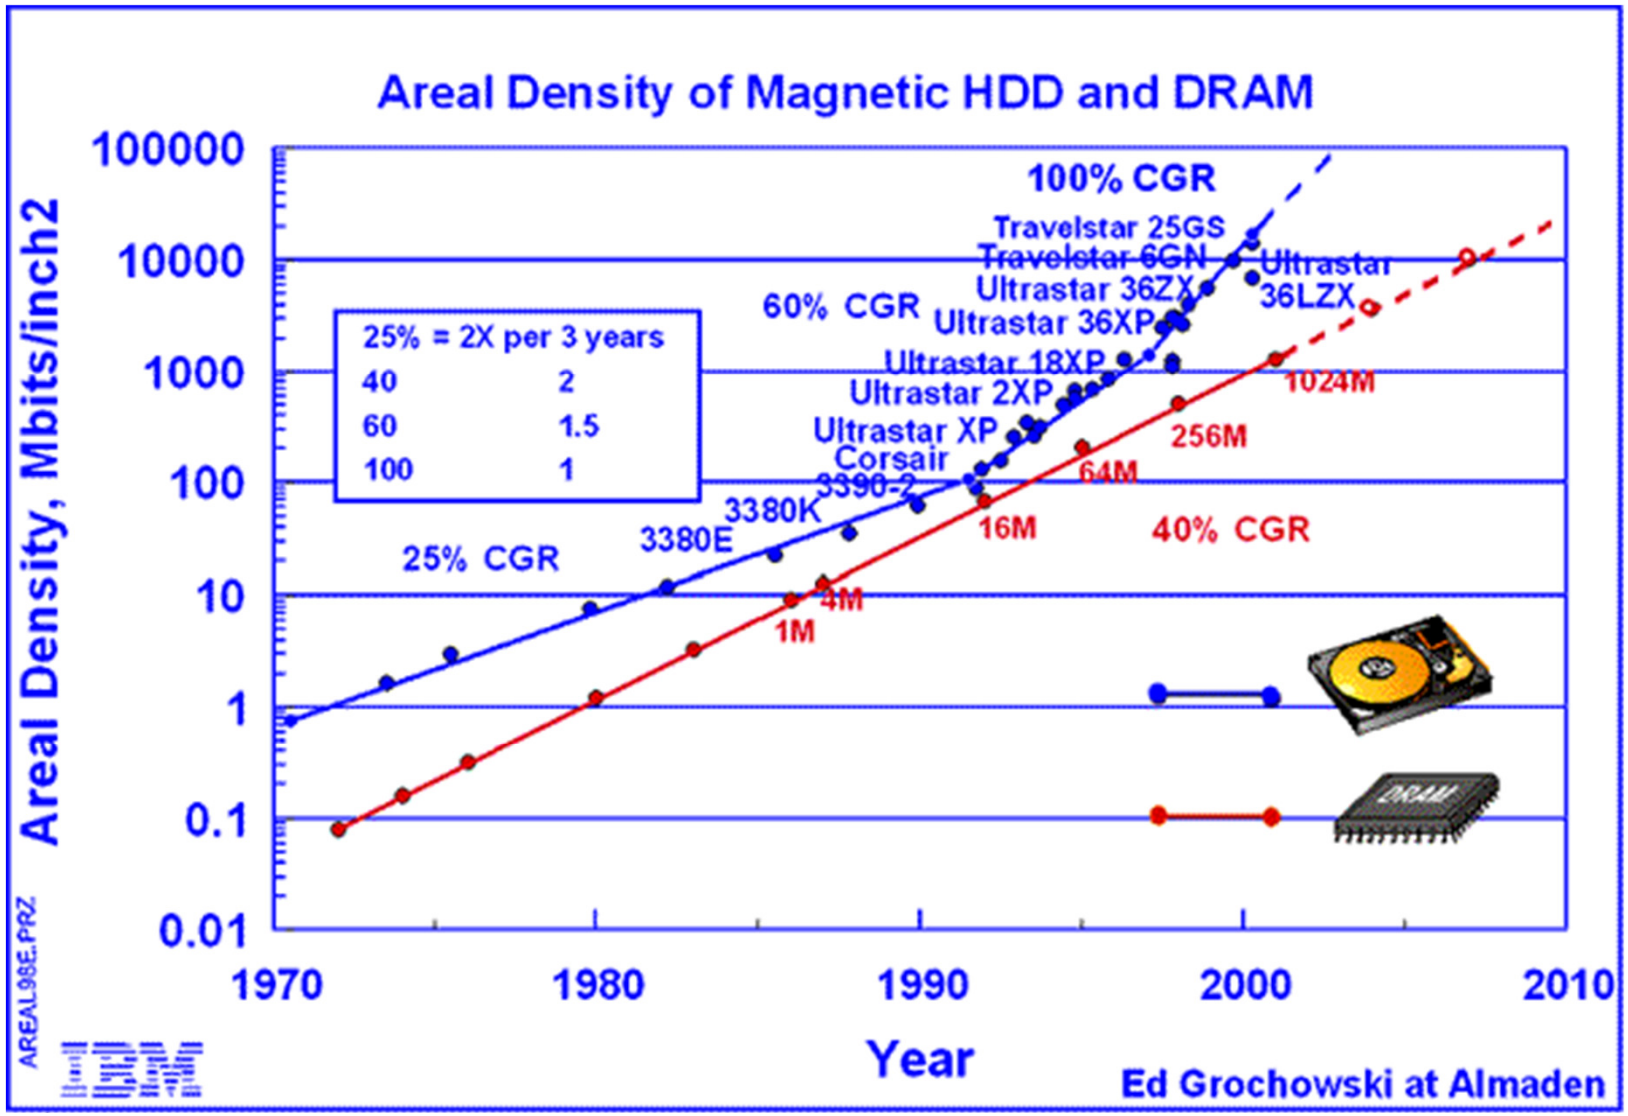
Parameter	IBM 360-KB floppy disk	WD 18300 hard disk
Number of cylinders	40	10601
Tracks per cylinder	2	12
Sectors per track	9	281 (avg)
Sectors per disk	720	35742000
Bytes per sector	512	512
Disk capacity	360 KB	18.3 GB
Seek time (adjacent cylinders)	6 msec	0.8 msec
Seek time (average case)	77 msec	6.9 msec
Rotation time	200 msec	8.33 msec
Motor stop/start time	250 msec	20 sec
Time to transfer 1 sector	22 msec	17 µsec

Disk parameters for the original IBM PC floppy disk and a Western Digital WD 18300 hard disk

Things to Note

- Average seek time is approx 12 times better
- Rotation time is 24 times faster
- Transfer time is 1300 times faster
  - Most of this gain is due to increase in density
- Represents a gradual engineering improvement

Storage Capacity is 50000 times greater



Estimating Access Time

- *Seek time* T_s: Moving the head to the required track
  - ⋆ not linear in the number of tracks to traverse:
    - ➜ startup time
    - ➜ settling time
  - ⋆ Typical average seek time: a few milliseconds
- *Rotational delay:*
  - ⋆ rotational speed, r, of 5,000 to 10,000rpm
  - ⋆ At 10,000rpm, one revolution per 6ms $\Rightarrow$ average delay 3ms
- *Transfer time:*
  to transfer b bytes, with N bytes per track: $T = \frac{b}{rN}$

Total average access time: $T_a = T_s + \frac{1}{2r} + \frac{b}{rN}$

A Timing Comparison

- $T_s = 2$ ms, $r = 10,000$ rpm, 512B sect, 320 sect/track
- Read a file with 2560 sectors (= 1.3MB)
- File stored compactly (8 adjacent tracks):

Read first track	
Average seek	2ms
Rot. delay	3ms
Read 320 sectors	6ms
	11ms

$\Rightarrow$ All sectors: $11 + 7 * 8 = 67\ ms$

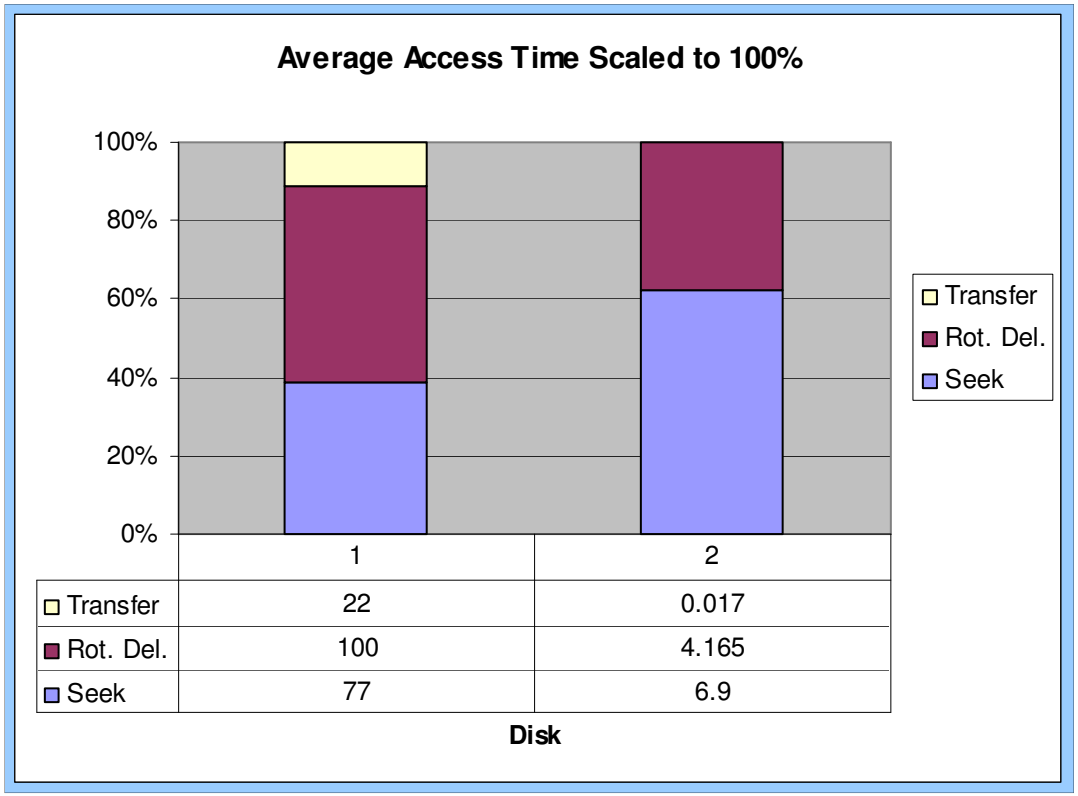
- Sectors distributed randomly over the disk:

Read any sector	
Average seek	2ms
Rot. delay	3ms
Read 1 sector	0.01875ms
	5.01875ms

$\Rightarrow$ All: $2560 * 5.01875 = 20,328ms$

Disk Performance is Entirely Dominated by Seek and Rotational Delays

- Will only get worse as capacity increases much faster than increase in seek time and rotation speed
  - Note it has been easier to spin the disk faster than improve seek time
- Operating System should minimise mechanical delays as much as possible



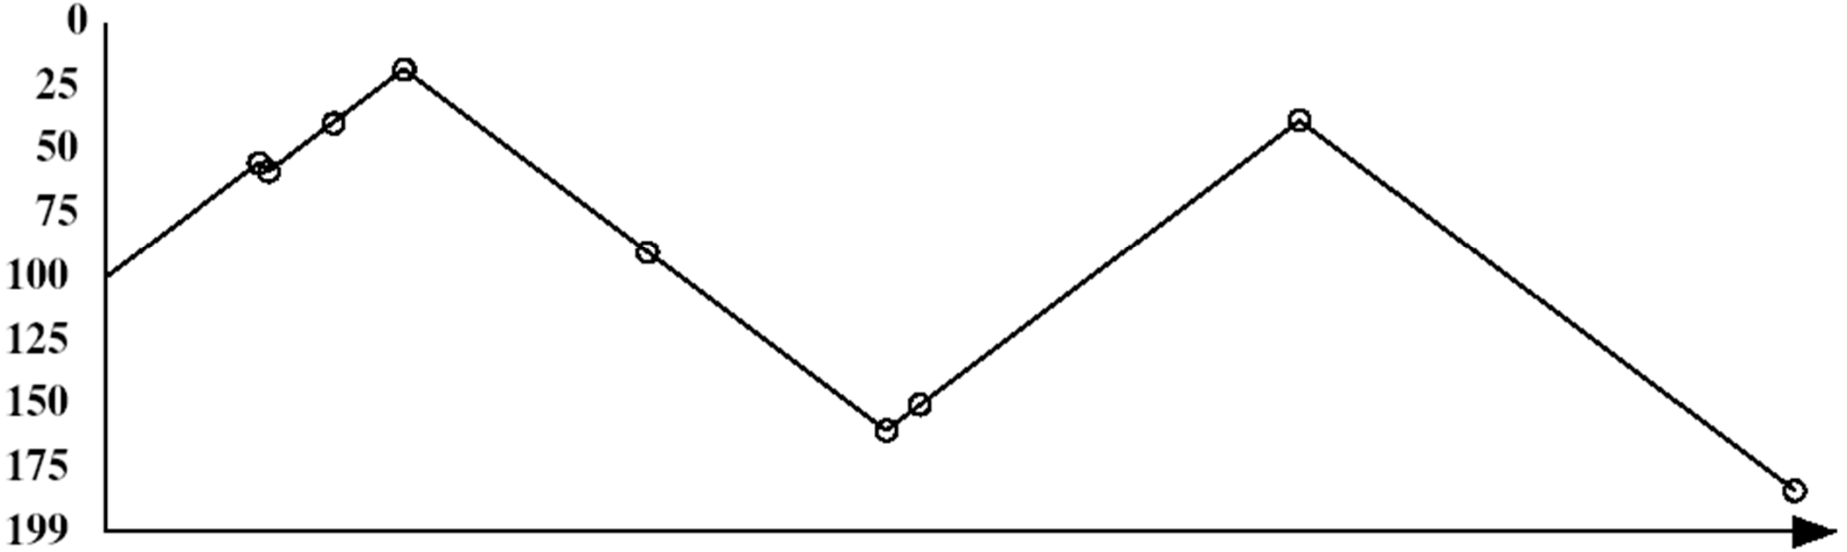
Disk Arm Scheduling Algorithms

- Time required to read or write a disk block determined by 3 factors
  1. Seek time
  2. Rotational delay
  3. Actual transfer time
- Seek time dominates
- For a single disk, there will be a number of I/O requests
  - Processing them in random order leads to worst possible performance

First-in, First-out (FIFO)

- Process requests as they come
- Fair (no starvation)
- Good for a few processes with clustered requests
- Deteriorates to random if there are many processes

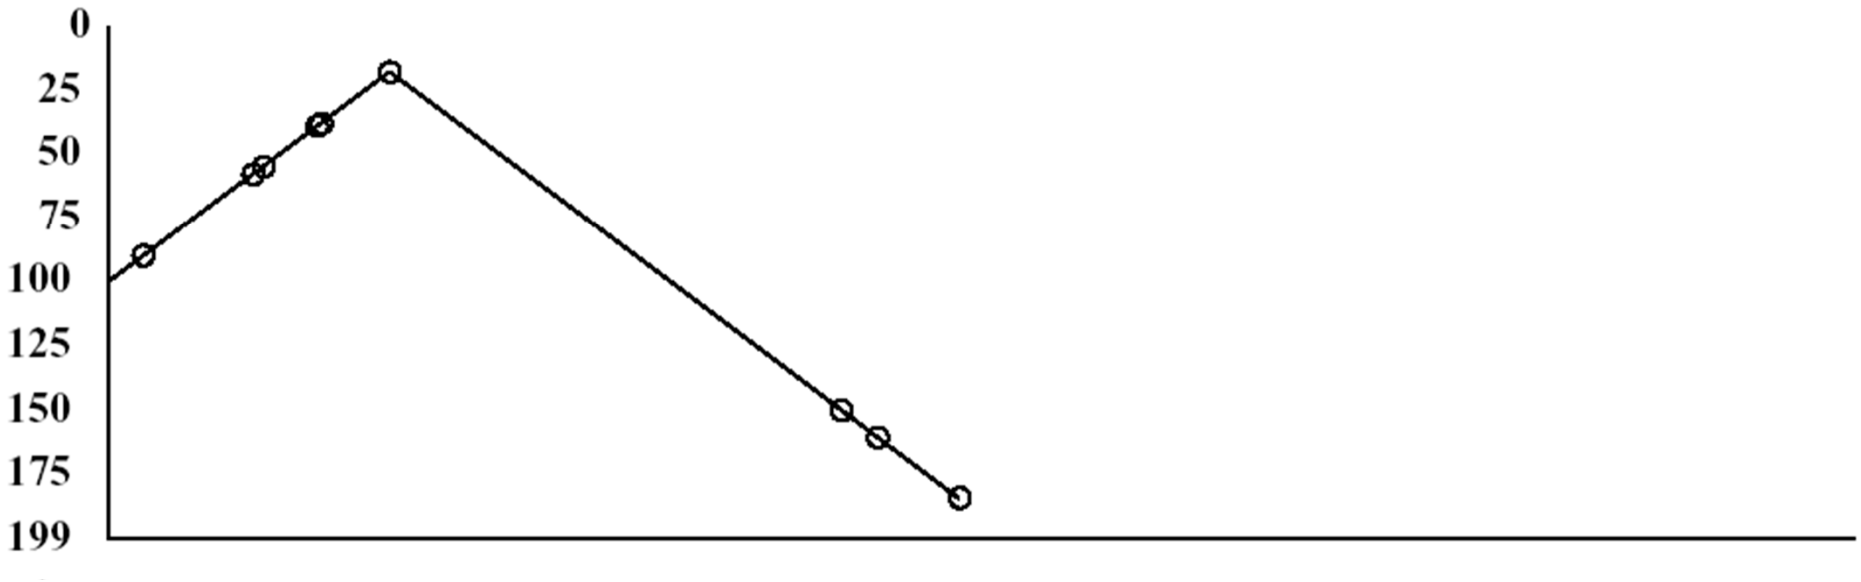
Request tracks: 55, 58, 39, 18, 90, 160, 150, 38, 184



Shortest Seek Time First

- Select request that minimises the seek time
- Generally performs much better than FIFO
- May lead to starvation

Request tracks: 55, 58, 39, 18, 90, 160, 150, 38, 184



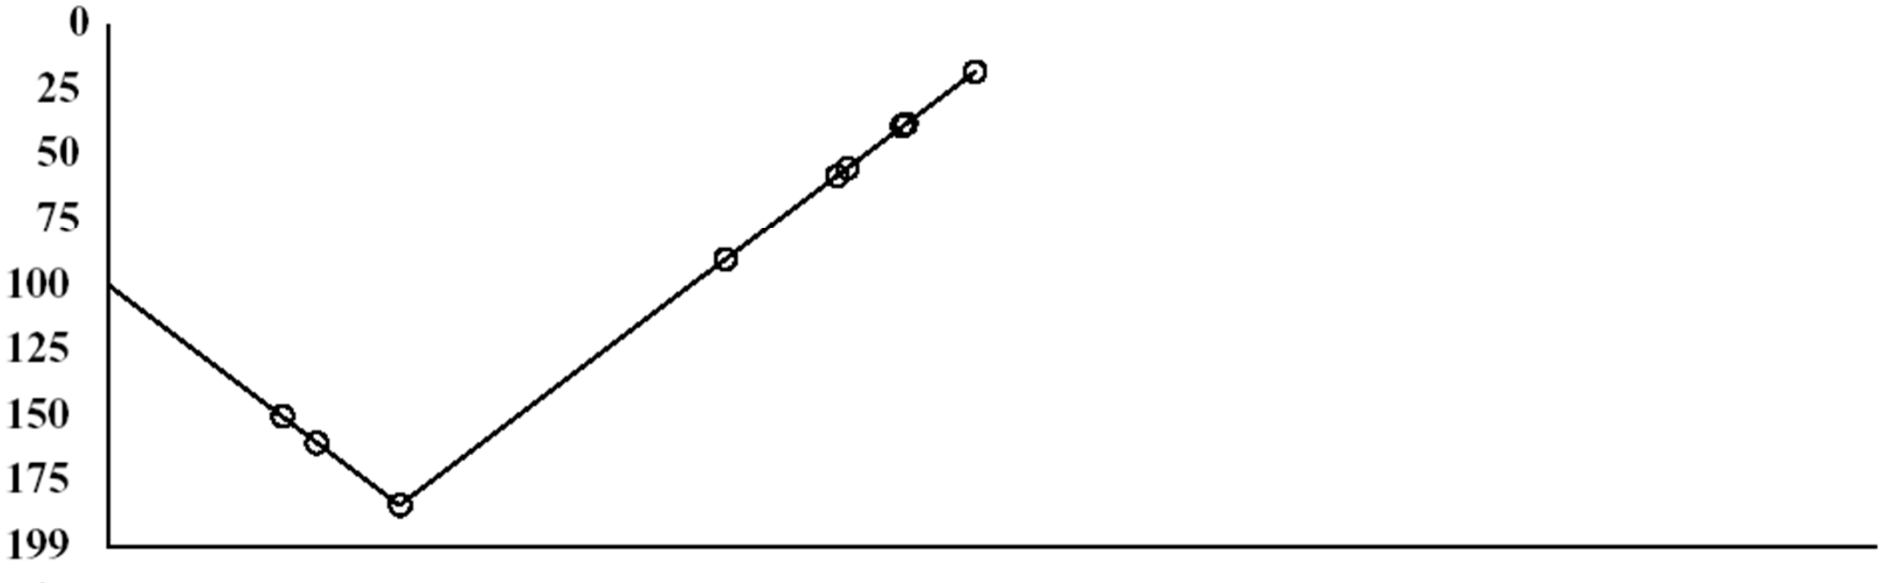
Elevator Algorithm (SCAN)

- **Move head in one direction**

–Services requests in track order until it reaches the last track, then reverses direction

- **Better than FIFO, usually worse than SSTF**
- **Avoids starvation**
- **Makes poor use of sequential reads (on down-scan)**
- **Inner tracks serviced more frequently than outer tracks**

Request tracks: 55, 58, 39, 18, 90, 160, 150, 38, 184



Modified Elevator (Circular SCAN, C-SCAN)

- Like elevator, but reads sectors in only one direction
  - When reaching last track, go back to first track non-stop
    - Note: seeking across disk in one movement faster than stopping along the way.
- Better locality on sequential reads
- Better use of read ahead cache on controller
- Reduces max delay to read a particular sector

Request tracks: 55, 58, 39, 18, 90, 160, 150, 38, 184
